**Molecular Radar**

This is an innovative technology platform for identification and characterization of bio-threats, as well as for molecular infectious disease diagnosis and genotyping. It is based on bioinformatics and companion analysis to identify unique and functionally important biomarkers. Currently, the CDC, FDA and other U.S. agencies are evaluating the technology as a CDC Category pathogen array and HIV genotyping array and others. As a molecular infectious disease diagnostics, this patented technology addresses a \$1 billion market.
